1. Field of the Invention The present invention relates to an image recording method, an image recording apparatus and an image recording medium and, more particularly, to an image recording method and an image recording apparatus by which, when a continuous sheet is used as an image recording medium and image recording is performed on the continuous sheet while a roll of the continuous sheet is supplied, the continuous sheet is cut at the trailing end of a recording area to obtain a recording portion having an appropriate length and, thereafter, the continuous sheet is supplied again, so that the image recording is performed on a new recording area at the leading end of the continuous sheet, and an image recording medium.

2. Related Background Art An image recording apparatus that performs image recording on a continuous sheet by using a recording material (hereinafter referred to as the continuous sheet) in which a plurality of roll-like recording areas are formed in parallel has been widely used. For example, such an image recording apparatus is used in a facsimile apparatus in which recording on both sides of a sheet is enabled, a copying apparatus in which recording on both sides of a sheet is enabled, a digital multi-function peripheral apparatus in which recording on both sides of a sheet is enabled, and the like. By using such an image recording apparatus, when an original document is read by an original document reading apparatus such as a scanner and a picture signal obtained by the reading is sent to an image recording apparatus, the image recording apparatus starts recording on the continuous sheet by using a recording material (hereinafter referred to as the continuous sheet) on which a plurality of the recording areas in which image recording is performed are formed. In this case, when the continuous sheet is held at the trailing end of the recording area and the image recording is started, the continuous sheet is cut at the trailing end of the recording area. The continuous sheet on which the recording area is cut is wound back so that the continuous sheet is always held at the leading end of the continuous sheet. In addition, when the image recording of an original document is completed, the recording area on which the image recording was performed is released, the continuous sheet is moved to the trailing end thereof, and
